Proc. Natl. Acad. Sci. U.S.A. (1986) 83:7216-7220
Structural evidence that endothelial cell growth factor beta
is the precursor of both endothelial cell growth factor
alpha and acidic fibroblast growth factor.
                        #fitle Characterization of a bovine acidic FGF cDNA clone and its expression in brain and retina.

The acidic and basic fibroblast growth factors are the major endcthelial-cell growth factors. Both are angiogenic agents in vivo and are potent mitogens for a variety of mesoderm-derived cell types in vitro (although bFGF is 30-100 times more potent than aFGF in stimulating the proliferation of normal diploid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This protein binds heparin more strongly than does aFGF.

### ALIGNMENTS

Synergistic antiviral composition contains BFGF and sulphated by Polyaaccharide - for treating viral infections e.g. HSV-1 and -2, cytomegalovirus, HIV, influenza virus etc.

Totomegalovirus, FIV, influenza virus etc.

Disclosure; Page 4; 20pp; English.

This sequence represents acidic fibroblast growth factor (aFGF).

aFGF, or its fragments may be used in synergistic compsn. with an antivirally active sulphated polysaccharid;, and one or more excipients. The compsn. may be used to control herpes simplex virus (HSV-1 or -2) herpes varicella/zoster; cytcmegalovirus; influenza; human respiratory syneytial virus; Semliki Forest virus; HIV or Moloney Sarcoma virus. The combination of aFGF with sulphated cyplysaccharide is found to have a greater antiviral activity than sequence 140 AA; 26-JAN 1993 (first entry)

Claim 2; Column 30; 25pp; English.

Oligonucleotides were synthesized on the basis of the amino acid sequence of bovinne acidic fibroblast growth factor (aFGF) and used to produce a synthetic gene (given in Q88233) incorporating codons preferred by E. coll or mammalian cells, unique cloning aftes, etc. This synthetic gene was mutagenized to obtain a gene encoding a human recombinant aFGF (R74547) having activity

                                                                                                                                                               Isolated, purified, biologically active bovine beta endothelial cell growth factor - useful to regenerate or treat damaged blood vessels bisclosure; F19 8: 28pp: English.

Disclosure; F19 8: 28pp: English.

Bovine beta endothelial cell growth factor (beta-ECGF; W035:9) having a mol.wt. of 20 kD can be purified at least 16300 fold from bovine brain using heparin. Sepharose affinity chromatography. ECGF is useful for, among other purposes, dinignostic applications and has potential in the treatment of damaged blood vessels or other Human ECGF (737503) or fragments may be obtained using oligonucleotides (737504 to 737508 to 737509) whose design is based on the sequence of bovine alpha- and beta-ECGF.

13-JUN-1991 (first entry)
Sequence of human proteinaceous factor (PFI) with mitogenic activity.
Cell growth promoter; mitogen; vascularisation; wound healing.
Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mitogenic polypeptide isolated from human brain tissue - useful for increasing vascular effect in eg wound healing, or generating endothelial cell linings for vascular prostheses, etc. (Claim 3; Page 1; 31pp; English.

The PF of the invention was obtd. from human brain tissue. It has a ' wt. of 15,200-16,500 (pref. 15,616-16,056) and has a high 'ty for heparin. PF1 and fragments are useful for promoting the "mesoderm-derived cells on neuroectoderm-derived cells and 'ndothelial cell linings for vascular prostheses (all 'vopeptides are useful for increasing vascularisation.
                                                                                                                                                                                                                                                                                                                                                                                                                             6 GNYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVYIKSTETGQYL 65

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene encoding human acidic fibroblast growth factor -
incorporates useful restriction sites at frequent intervals to
facilitate cassette mutagenesis of specified regions.

Claim 2: Fig 3a: 12pp; English.

The synthetic arGF gene incorporates useful restriction sites at
frequent intervals to facilitate the cassette mutagenesis of
selected regions. Also included are flanking sites to simplify
the incorporation of the gene into any expression system.

The arGF mol. acts in a cascade effect to control endothelial cell
activity either co-ordinately through synergistic effects or via
independent routes. The regulation of endothelial cells is essential
for the protection of arteries, veins and capillaries from the effect
of thrombogenesis. Their stimulation and control by these factors is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20-APR-1999 (first entry)

Human beta-endothelial cell growth factor (ECGF) protein sequence.

Claim 1. Column 16: 23pp; English.

This represents the amino acid sequence of human beta-endothelial cell growth factor (ECGF). The invention is directed to DNA encoding alpha or beta-ECGF and plasmids comprising the DNA sequences. The DNA encodes a cleavable signal peptide and an ECGF, where removal of the signal peptide yields a mature form of the ECGF. The DNA is used to produce recombinant ECGF proteins, which can be used in treatments to repair or regenerate blood vessels or other structures lined with endothelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  W03999) having

Bovine beta-endothelial cell growth factor (beta-ECGF; W03999) having a mol.wt. of 20 kD can be purified at least 16300 fold from bovine brain using heparin-Sepharose affinity chromatography. ECGF is potential in the treatment of damaged blood vessels or other endothelial cell-lined structures.

Human ECGF (177503) or fragments may be obtained using on the sequence of bovine alpha- and beta-ECGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       20 GNYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVYIKSTETGQYL 79

Compositions for promoting wound healing - containing endothelial cell growth facto: polypeptides claim 1; column 15; 23pp; English.

This sequence represents the amino acid sequence of the mature human beta-endothelial cell growth factor (b-ECGF). This amino acid sequence 1s identical to the alpha-ECGF but the beta sequence contains an extra 20 N-terminal amino acids. The sequence was isolated from a human brain stem cell cDNA library using a probe designed based on fragments of the bovine ECGF (see W75416-W75418). The ECGF protein can be used in compositions for promoting wound healing. ECGF is also used to grow sequence 154 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           80 AMDTDGLLYGSQTPNEECLFLi;RLEENHYNTYISKKHAEKNWFVGLKKNGSCKRGPRTHY 139

(Claim 1; Column 16; 22pp; English,
Human recombinant endothelial cell growth factors (EGGF) beta
(W06816) and alpha (W06817) differ only at their N-terminal ends.
They can be produced in transformed prokaryotic or eukaryotic host
cells using DNA sequences (T45983 and T45984, respectively) derived
from the complete human EGGF cDNA (T45985). Large quantities of
the EGGFs are produced by culturing the host cells and recovering
the proteins. EGGFs have utility in the growth and amplification
of endothelial cells in culture. They can potentially be used to
treat damaged blood vessels and other endothelial cell-lined

Novel fusion proteins comprise FGF linked to saporin. FGF-1 to -9 may be used, pref. FGF-1 (R70812), FGF-5 (R70813), FGF-7 (R70814) or FGF-8 (R70815) muteins, in which at least 1 Cys residue is replaced by conservative Ser substitutions. The fusion proteins are potent sytooidal agents to cells bearing the FGF receptor.

ECGF inserts, a specific obligonucleotide was designed. This colliponucleotide was designed. This colliponucleotide was based upon a partial AA sequence analysis of the amino terminus of ECGF (see P704408 and P70481). Fig 3s ests forth for comparison the AA sequence of cyanogen bromide-cleaved bovine alpha and beta ECGF (P70834). The two clones that were isolated, ECGF clones 1 and 29, were analysed in further detail. The nucleotide sequence of these clones and the AA sequence deduced from the nucleic acid sequence is shown in Fig 8 (see N70788 and P70482).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GNYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVYIKSTETGQYL 80

"Endothelial cell growth factors in embryonic and adult chick brain are related to human acidic fibroblast growth factor.";
EMBO J. 7:959-962(1988).
-1- FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIOGENIC AGENTS IN VIVO AND ARE POTENT MITOGENS FOR A VARIETY OF CELL TYPES IN VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND CONCENTRATION OF THESE 2 GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -!- SUBUNIT: MONOMER.
-!- MISCELLANDOUS: THIS PROTEIN BINDS HEPARIN, ALTHOUGH LESS STRONGLY
THAN DOES BFGF.
-!- SIMILARITY: BELONGS TO THE HEPARIN-BINDING GROWTH FACTORS FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            77 GQYLAMDTNGLLYGSQLPGEECLFLERLEENHYNTYISKKHADKNWFVGLKKNGNSKLGP 136

Bovine beta-endothelial cell growth factor (beta-ECGF; W03999) having a mol.wt. of 20 kD can be purified at least 16300 fold from bovine brain using heparin-Sepharose affinity chromatography. ECGF is potential for, among other purposes, diagnostic applications and has potential in the treatment of damaged blood vessels or other endothelial cell-lined structures.

Human ECGF (137503) or fragments may be obtained using oil gonucleotides (137504 and 137508 to 737509) whose design is based on the sequence of bovine alpha- and beta-ECGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              12 TEKFNLP-PG--NYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEV 68
                                                                                                                               Glaim 1. Column 16: 22pp; English.

Human recombinant endothelial cell growth factors (ECGF) beta

(W06816) and alpha (W06817) differ only at their N-terminal ends.

(W06816) and alpha (W06817) differ only at their N-terminal ends.

They can be produced in transformed prokaryotic or eukaryotic host
cells using DNA sequences (T45983 and T45984, respectively) derived

from the complete human ECGF cDNA (T45885). Large quantities of
the ECGFs are produced by culturing the host cells and recovering
the proteins. ECGFs have utility in the growth and amplification
of endothelial cells in culture. They can potentially be used to
treat damaged blood vessels and other endothelial cell-lined
structures, and also have diagnostic appins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         29-DEC-1996 (first entry)

Human beta-endothelial cell growth factor.

Endothelial cell growth factor; ECGF; blood vessel; regeneration;

heparin-Sepharose affinity chromatography; probe; oligonucleotide;

RGF; fibroblast growth factor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cell growth factor polypeptides.

Claim 1; Column 16; 23pp; English.

This sequence represents the amino acid sequence of the mature human beta-endothelial cell growth factor (b-ECGF). This amino acid sequence is identical to the alpha-ECGF but the beta sequence contains an extra 20 N-terminal amino acids. The sequence was isolated from a human brain stem cell cDNA library using a probe designed based on fragments of the bovine ECGF (see W75416-W75418). The ECGF protein can be used in compositions for promoting wound healing. ECGF is also used to grow sequence 154 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                69 YIKSTETGQYLAMDTDGLLYGSQTPNEECLFLERLEENHYNTYISKKHAEKNWFVGLKKN 128
